This article offers a comprehensive overview of common respiratory medications, their classes, mechanisms of action, indications, side effects, and nursing considerations to serve as a reliable cheat sheet in clinical practice.

Overview of Respiratory Medications

Respiratory medications are drugs used to treat conditions affecting the lungs and airways, such as asthma, chronic obstructive pulmonary disease (COPD), bronchitis, and allergic reactions. They can be broadly classified into bronchodilators, anti-inflammatory agents, expectorants, mucolytics, and leukotriene modifiers.

Common Classes of Respiratory Medications

1. Bronchodilators

Bronchodilators relax the smooth muscles of the airways, leading to dilation and improved airflow. They are primary medications for acute bronchospasm and maintenance therapy.

- **Beta-2 Adrenergic Agonists**
- **Anticholinergics**
- **Methylxanthines**

2. Anti-inflammatory Agents

These drugs reduce airway inflammation, swelling, and mucus production, mainly used in asthma and COPD management.

- **Corticosteroids**
- **Leukotriene Receptor Antagonists**
- **Cromolyn Sodium**

3. Expectorants and Mucolytics

These agents help loosen mucus, making it easier to cough up.

- Expectorants (e.g., Guaifenesin)
- Mucolytics (e.g., Acetylcysteine)

Detailed Overview of Respiratory Medications

1. Beta-2 Adrenergic Agonists

These are quick-relief medications used during acute bronchospasm episodes.

Examples:

- Albuterol (Ventolin, ProAir)

- Shake inhalers well before use
- Use spacer devices if recommended
- Inhale slowly and deeply with inhalers
- Rinse mouth after corticosteroid inhaler use
- Clean nebulizer equipment regularly

Patient education also involves recognizing early signs of respiratory
